

European mortality bulletin week 10, 2011: Mortality has over the past month been within the normal range for all countries.

Over the last weeks, all-cause number of deaths, corrected for delay in local reporting of deaths, has been below 2 z-scores. The tendency over the last few weeks of being below the expected number of death may be due to insufficient adjustment in delay in local reporting.

EuroMOMO: week 10 year 2011

Cumulated excess deaths for this season compared to previous seasons are within the same range. For children below 5 years of age, we continue to see a relative low and stable number of deaths just below the expected number of deaths. Among adults (15 to 64 years of age) a lower number of deaths compared to the expected as well as to previous seasons, after a slight catch-up through December, seems to have stabilised.

The analyses, based on ten countries, were adjusted for differences in local delay of reporting and heterogeneities in pattern and variation between the included countries.
